

Example Explanation Improvement

```
1 public class Main {
2     public static void main(String[] args) {
3         int x = 3;
4         int y = 5;
5         Main inst = new Main();
6         inst.test(x, y, 9);
7     }

8     public void test(int x, int z, int r) {
9         System.out.println("Testing ExSymExe29");
10        if (z != x) System.out.println("branch F001");
11        else System.out.println("branch F002");
12        if (x != r) System.out.println("branch B001");
13        else {
14            assert false;
15            System.out.println("branch B002");
16        }
17    }
18 }
```

Explanation by the NLM base model

```
1 public class Main {
2     public static void main(String[] args) {
3         int x = 3;
4         int y = 5;
5         Main inst = new Main();
6         inst.test(x, y, 9);
7     }

8     public void test(int x, int z, int r) {
9         System.out.println("Testing ExSymExe29");
10        if (z != x) System.out.println("branch F001");
11        else System.out.println("branch F002");
12        if (x != r) System.out.println("branch B001");
13        else {
14            assert false;
15            System.out.println("branch B002");
16        }
17    }
18 }
```

Explanation by the EGL model after relevance guidance

Additional focus is now placed on the relevant line 12 by the model while the extra attention placed on 11 by base has been reduced (overall making the line a much lower priority).
